

## 2.5 - Factoring and Complex Zeros

---

---

### Skills

- Find a polynomial with a given set of zeros
  - Identify the zeros and multiplicities of a polynomial
- 
- 
- 
- 
- 
- 
- 
- 
- 
- 
-

# Factors and Roots

---

---

The following are equivalent:

---

$(x - a)$  is a **factor** of a polynomial

---

$x = a$  is a **root** or **zero** of the polynomial

---

---

---

---

---

---

---

---

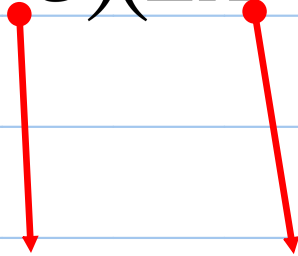

---

---

---

# Worked Example

Find the roots of  $(x + 5)(2x - 3)$

$$x = -5, x = \frac{3}{2}$$

# Multiplicity

The **multiplicity** of a factor/root indicates the exponent that the factor has.

$$(x - 1)(x + 3)^2$$

multiplicity 1  multiplicity 2 

# Worked Example

---

---

Write a polynomial with roots  
1 and -2 (multiplicity 3).

---

---

$$(x - 1)(x + 2)^3$$

---

---

---

---

---

---

---

---

---

---

# Example

---

Find the roots (and multiplicities) of

---

$$(x - 3)^3(x - 5)$$

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

# Example

Write a polynomial with roots  
1, -1 and 2 (mult. 3)

# Irrational Roots

---

If your polynomial is "pretty," then these must come in **conjugate pairs**.

*(typically, with a  $\pm$  in front of a radical)*

You'll find these through **factoring**, or the quadratic formula.

---

---

---

---

---

---

---

---

---

---

Example

$$(x - 2)(x^2 - 5)$$

# Non-Real Roots

---

---

You'll also find these through factoring, or the quadratic formula.

These will also come in conjugate pairs.

---

---

---

---

---

---

---

---

---

---

Example

$$(x^2 - 1)(x^2 + 1)$$
